## 1 Description

This document characterizes execution times measured on a simple program in pure-computation mode, called *INC*, with increasing task lengths (up to 16,384 seconds from 1 second). For the characterization, we present various histograms of INC throughout this document. The main goal of examining these histograms is to make sure if two (or more) histograms of INC with the same task length have the same shape or not. If that's the case, then we can say that such an INC run is so called *repeatable*; in other words, *repeatability* is satisfied in our experimental settings. Another goal is to uncover and explicate several interesting structures behind the histograms. The third goal is to build a statistical distribution (or model) fitting in the histograms, so that later we are capable of predicting a concrete execution time via the model on an arbitrary algorithm with a given input on a real execution environment.

In our experiments, we used EMPv5 [1]. (That said, the second step of EMPv5 was on purpose omitted, just to obtain better histograms by retaining more samples.) In the protocol, we use taskstats C struct to get measures of a captured process. The taskstat's data is delivered via a netlink socket from the kernel space. The receive buffer for the socket is not robust for many observed processes [2]. Fortunately, there is an average of 95 processes per iteration of a run, which turns out to be fine with the struct. For a much more number of processes, the use of /proc/[pid]/stat is preferred, as (i) there are equivalent measures available in the /proc filesystem, and (ii) there's little constraint on the use as opposed to taskstats.

Now we show histograms of elapsed time (ET) and process time (PT) of INC via the EMPv5 protocol.

## 2 Histograms on the First Run

This section exhibits histograms on the first run of INC with its task length increasing from 1 second to 4,096 seconds. The detailed description of the base data is from Table 1.

**Experiment Notes:** Table 1 provides a short description of our experimental runs, on which the following histograms are based.

Machine	Task Length	Description	Experiment Period	Relevant
	(sec)			Histograms
sodb9 (plugged	INC1~INC64	1000 samples, each	$2017-03-02 \sim 2017-03-04$	Figs. 1, 2, 5, and 6
into the upper left				
power strip)				
sodb9 (plugged	INC19,	1000 samples, each,	2017-05-31, 2018-12-03,	Figs. 6, 7, and 8(b)
into the upper left	INC20,	applied by EMPv4	$2019-03-04 \sim 2019-03-14$	
power strip)	INC21.125,			
	INC60,			
	INC62,			
	INC224			
sodb9 (plugged	INC128∼	300 samples, each	$2017-03-04 \sim 2017-03-11$	Figs. 3, 8, and 9
into the upper left	INC1024			
power strip)				
sodb10 (plugged	INC2048	300 samples	$2017-03-02 \sim 2017-03-09$	Figs. 4(a) and 9(b)
into the upper left				
power strip)				
sodb12 (plugged	INC4096	300 samples	$2017-02-13 \sim 2017-02-27$	Figs. 4(b) and 9(c)
into the upper right				
power strip)

## 2.3 Additional Histograms

This section exhibits the histograms of INC with some intermediate task lengths under 256 secs. These histograms are intended to investigate where the crossing and merge of two peaks that are consistently observed up to INC128 happened. Table 2 provides a description of the intermediate runs.

Machine	Task Length (sec)	Description	Experiment Period	Relevant
				Histograms

#### 2.4 Summary

Stacked Histograms in a 3D Plot: Figure 14 represents a 3D plot of collecting the histograms of PT in Section 2.2. Note that we additionally include the histograms from the task lengths of 8192 and 16384 seconds, which will be shown in Figures 39(c) and 39(d) (on page 47). See the legend in the right hand side of the figure, for more details about specific task length information. (To obtain the better shape, we could remove from those histograms the outliers that are identified via the second step of EMPv5.) The x-axis corresponds to the normalized PT relative to the minimum, ranging 0 to 100, the y-axis to task length in log scale, and the z-axis to the normalized frequency relative to the highest bar for each histogram.

One thing to notice is that there are some runs having a few empty bins in their respective histogram. For instance, INC32 has such an empty bin as shown in Figure 2(b). Same with INC256 in Figure 3(b). For such an INC run, the z-axis associated with its histogram has the zero value on the x-axis in Figure 14.

## 3d Stacked Histogram

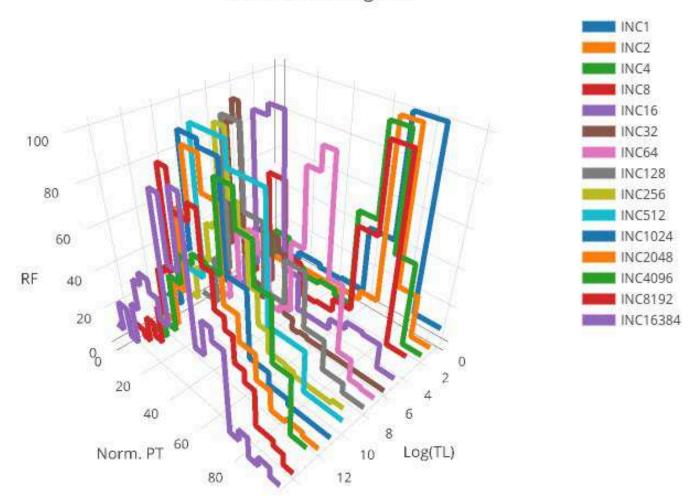

Figure 14: 3D histograms of PT on doubly-increasing INC on sodb9 for up to INC1024, on sodb10 for INC2048, on sodb12 for INC4096

Figure 15 represents a 3D plot of collecting the histograms of user time only exhibited in Section 2.

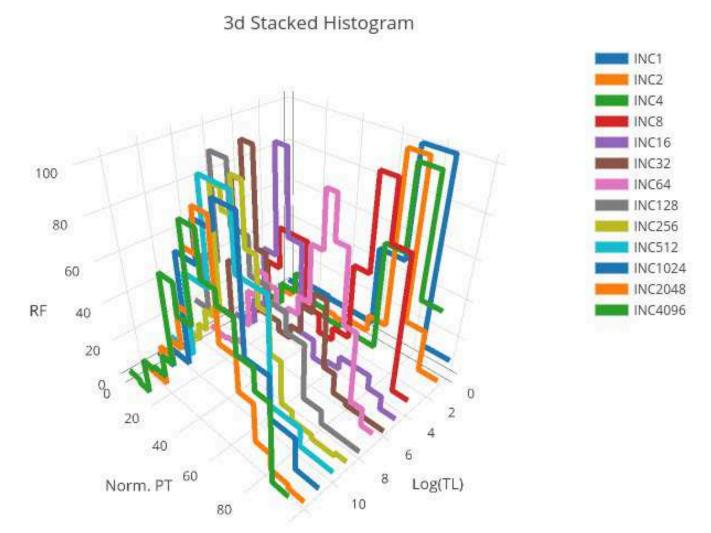

Figure 15: 3D histograms on INC on sodb9 for up to INC1024, on sodb10 for INC2048, on sodb12 for INC4096: user time only

Fitting PT Histograms in Bi-Normal Distributions: We ran Rob's code to obtain a bi-normal fit for each INC's PT histogram in Section 2. Table 3 exhibits the total range of bins, the two means (modes), standard deviations, scales (weights) for the PT histogram, and figure numbers associated with each INC.

INC	Total Range	Mean 1	Mean 2	Std 1	Std 2	Scale 1	Scale 2	Figures
INC1	6	1.66	4.73	1.03	0.54	0.10	0.90	Fig. 5(a)
INC2	9	2.33	7.07	2.38	0.54	0.16	0.84	Fig. 5(b)

INC8	9	3.51	9.15	1.10	1.08	0.39	0.61	Fig. 5(d)
INC16	10	4.04	9.53	0.98	1.28	0.83	0.17	Fig. 6(a)
INC32	22	2.76	8.26	1.28	1.12	0.73	0.27	Fig. 7(a)
INC64	14	6.36	12.02	1.64	1.62	0.35	0.65	Fig. 7(d)
INC128	16	4.21	8.64	1.82	3.40	0.41	0.59	Fig. 8(a)
INC256	38	6.08	14.61	3.59	3.75	0.12	0.88	Fig. 8(c)
INC512	20	1.60	12.43	11.51	4.47	0.08	0.92	Fig. 8(d)
INC1024	40	1.13	18.88	14.99	6.01	0.06	0.94	Fig. 9(a)
INC2048	65	29.93	52.92	8.53	6.59	1.00	-0.00	Fig. 9(b)
INC4096	65	39.57	98.00	12.41	8.19	0.94	0.06	Fig. 9(c)

Table 3: Two means in mode computed for each INC

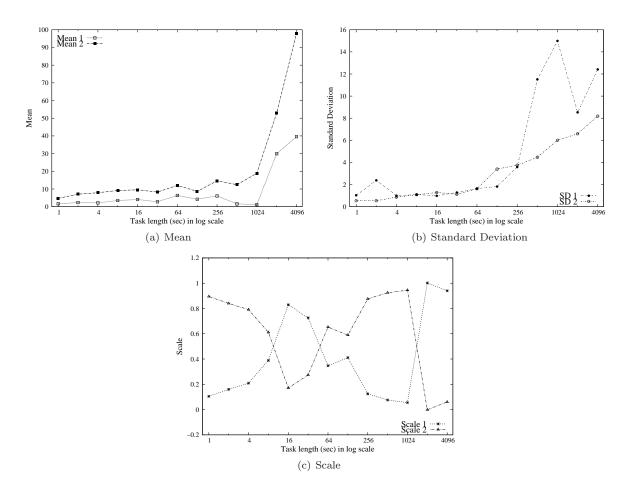

Figure 16: Plots of two means, standard deviations, and scales for each INC over increasing task length: based on Table 3

Absolute and Relative Variance over Increasing Task Lengths: Figure 17 exhibits absolute and relative variances over increasing task lengths. More specifically, Figures 17(a) and 17(b) concern the PT standard deviations of all the runs including those two longest runs of INC8192 and INC16384 described in Table 12. The x-axis is task length, and the y-axis standard deviation; Figure 17(b) is taken in log scale. Figures 17(c) and 17(d) shows the relative variance of the same data set—coefficient of variation (= standard deviation / task length (or mean)). Both of the x and y axes in these two figures are taken in log scale. We also overlap a linear-square-fit of each case on the same figure.

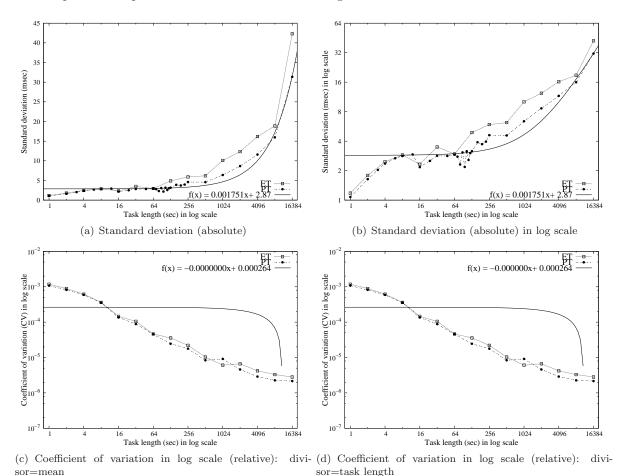

Figure 17: Absolute and relative variances

## 2.5 Histograms of User and System Time

This section exhibits histograms on user and system time of the INC runs described in Table 1.

#### 2.5.1 User Time

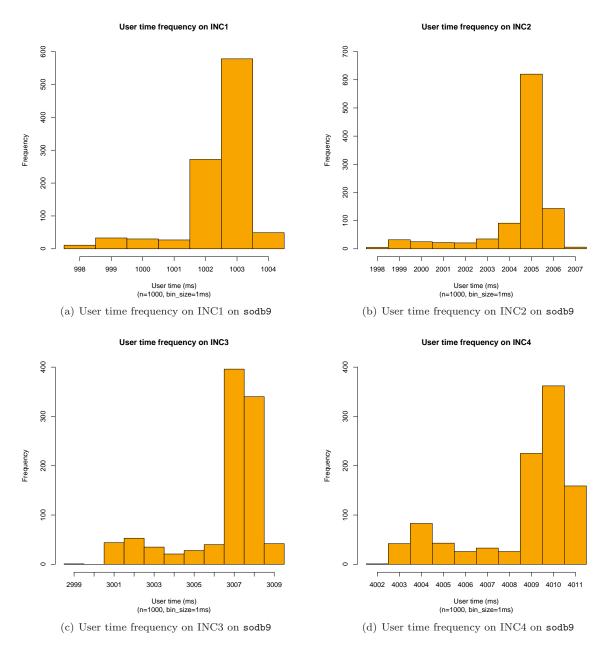

Figure 18: User Time Histograms of INC1 ... INC4

#### 2.5.3 Correlational Analysis on Selected Runs

In this section we perform correlational analysis between the user and system time of INC2048 and INC4096 runs and selected measures of the daemons captured on the two runs.

	INC2048's u time	INC2048's s time
INC2048's u time	-	0.05
daemon u time	0.56	0.61
daemon s time	0.48	0.57
daemon minor faults	0.53	0.62
daemon major faults	0.55	0.59
daemon read bytes	0.55	0.59
daemon read char	0.56	0.61
daemon read sys calls	0.57	0.63
daemon write bytes	0.57	0.64
daemon write char	0.53	0.62

Table 4: Correlation of user and system time of INC2048 with some daemon measures

	INC4096's u time	INC4096's s time
INC4096's u time	-	-0.30
daemon u time	0.1	0.3
daemon s time	-0.09	0.19
daemon minor faults	0.11	0.32
daemon read char	0.1	0.32
daemon read sys calls	0.11	0.32
daemon write bytes	0	0.26
daemon write char	0.11	0.32

Table 5: Correlation of user and system time of INC4096 with some daemon measures

**Scatter Plots on Some Significant Correlations:** The following scatter plots correspond to the correlations bold in Table 5.

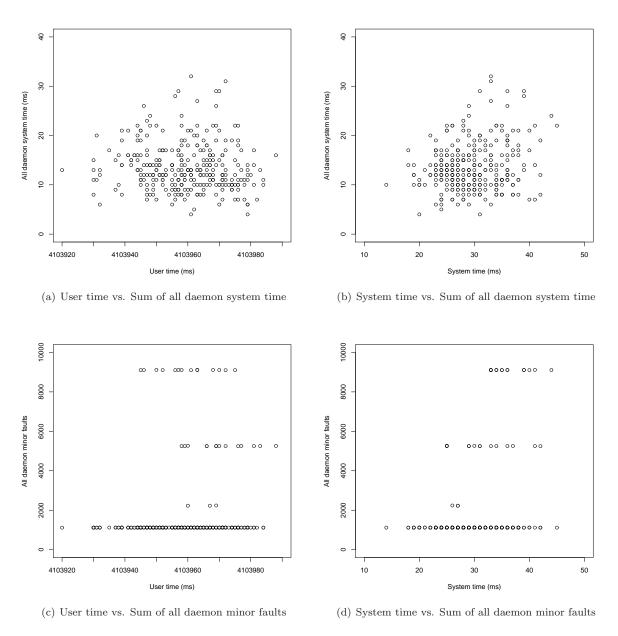

Figure 30: Scatter plots between measures on INC4096

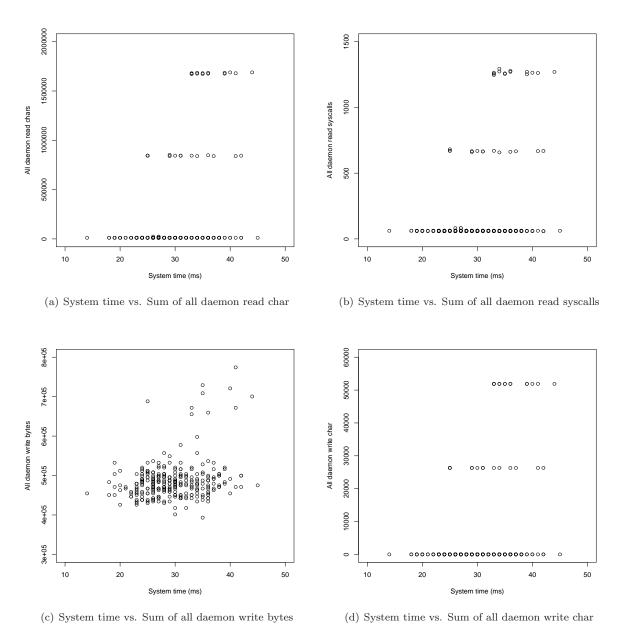

Figure 31: Scatter plots between measures on INC4096  $\,$ 

**Detailed Measures on Some Significant Samples:** The following tables show the breakdown of measures of processes observed on some distinct samples (leftmost or rightmost) in the selected runs.

proc name (id)	u time	s time	min flt	maj flt	r bytes	r char	r sysc	w bytes	w char	w sysc

# 3 Histograms on the Second Run

This section exhibits histograms on the second run of INC with its task length increasing from 1 second to 4096 seconds, via EMPv5 without Step 2. The detailed description of the base data is from Table 12.

Machine	Task Length (sec)	Description	Experiment Period	Relevant Histograms
sodb9 (plugged into the upper left power strip)	INC1~INC64	1000 samples, each	$2017-03-13 \sim 2017-03-14$	Figs. 32, 33, 36, and 37
sodb9 (plugged into the upper left power strip)	INC512~INC1024	300 samples, each	$2017-03-17 \sim 2017-03-21$	Figs. 34 and 38
sodb10 (plugged into the upper left power strip)	INC2048	300 samples	$2017-03-13 \sim 2017-03-20$	Figs. 35(a) and 39(a)
sodb12 (plugged into the upper right power strip)	INC4096	300 samples	$2017-03-02 \sim 2017-03-17$	Figs. 35(b) and 39(b)
sodb10 (plugged into the upper left power strip)	INC8192	261 samples	$2017-04-27 \sim 2017-05-21$	Figs. 35(c) and 39(c)
sodb12 (plugged into the upper right power strip)	INC16384	130 samples	$2017-04-27 \sim 2017-05-21$	Figs. 35(d) and 39(d)

Table 12: Notes on experiment runs used for histograms

 $\rm INC8192/INC16384$  unfortunately stopped in the middle of their runs due to a frozen vnc problem. So couldn't finish 300 samples.

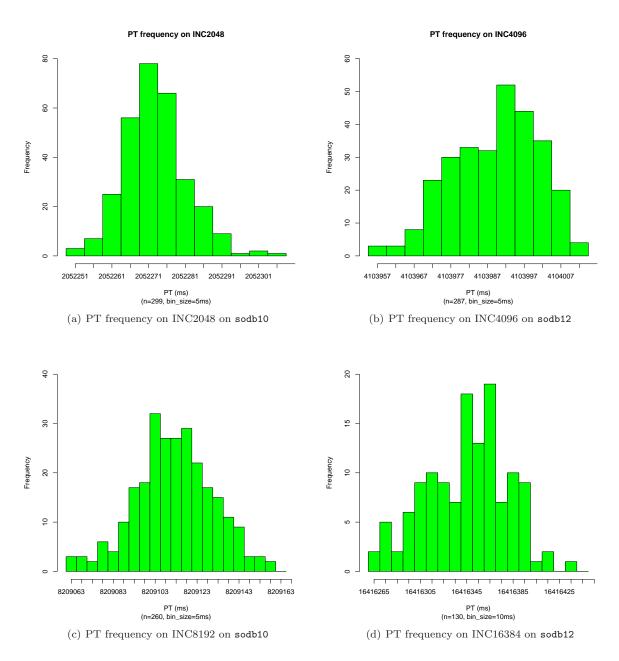

Figure 39: PT Histograms of INC2048 ... INC16384

### 3.2.1 Analysis

In this section we look into what happened inside the peaks observed in a certain histogram. We consider Figure 36(d) for this study. In the figure, we see the peaks at 8015 msec, 8020 msec, and 8021 msec.

Table 13 shows captured daemons and their runtime statistics per bin of figure. Note that bin is at the unit of PT. It appears that the peaks are definitely correlated with (1) appearances of some daemons and (2) times that those daemons co-ran with INC8.

TASK_LEN	BIN (PT)	DAEMON	MIN_PT	MAX_PT	AVG_PT	STD_PT	Counts
INC8	8013	jbd2/md0-8	1	1	1	0	1
INC8	8013	kslowd000	1	1	1	0	1

#### 3.2.2 Analysis on Some Outliers Found from INC16 and INC64 on sodb9

In this section we investigate what happened about some outlying samples on INC16 and INC64 shown in Figures 37(a) and 37(c).

Regarding INC16, we looked into detailed information of processes that were captured at one execution corresponding to the bin of 16,050 (frequency = 1) msec in PT. For the purpose of comparison, we also explored processes captured at the second-highest bin of 16,041 msec in PT.

Table 14 shows the overall information of the captured processes at the two bins. As indicated by the table, there were some infrequent daemon processes such as sshd, grep, md0\_raid1, cifsd, running for some time when the INC16 program was run.

Iteration number	Process ID	Process Name	PT (in msec)
77 (, 209, or 569)	10185	incr_work (=INC16)	16,041
	28525	proc_monitor	196
	167	kslowd001	1
	166	kslowd000	1
703	10185	incr_work (=INC16)	16,050
	28525	proc_monitor	196
	12322	sshd	14
	12313	sshd	13
	12324	grep	6
	472	md0_raid1	2
	12314	sshd	2
	12315	grep	2
	12319	grep	1
	167	kslowd001	1
	12323	sshd	1
	166	kslowd000	1
	12328	grep	1
	1925	cifsd	1

Table 14: Daemons observed at the second-rightmost and rightmost bins in Figure 37(a)

Regarding INC64, we looked into detailed information of processes that were captured at one execution corresponding to the bin of 64,151 (frequency = 1) msec in PT. For the purpose of comparison, we also explored processes captured at the second-highest bin of 16,041 msec in PT.

Table 15 shows the overall information of the captured processes at the two bins. As indicated by the table, there were also the same kind of infrequent daemon processes such as sshd, grep, md0\_raid1 as well as java running for some time when the INC64 program was run. It is conjectured that for a longer INC program, it is more frequent to have java with some positive time in PT.

Iteration number	Process ID	Process Name	PT (in msec)
795 (, 125, or 236)	16256	incr_work (=INC64)	16,142
	28525	proc_monitor	198
	167	kslowd001	4
	166	kslowd000	3
(125)	(472)	(md0_raid1)	(2)
	16246	java	2
759	16256	incr_work (=INC64)	64,151
	28525	proc_monitor	198
	19320	sshd	13
	19329	sshd	12
	19331	grep	5
	19322	grep	5
	167	kslowd001	3
	166	kslowd000	3
	16246	java	2
	2067	sshd	2
	19335	grep	1
	19330	sshd	1
	472	md0_raid1	1
	19326	grep	1

# 4 Histograms with 10,000 samples

This section exhibits histograms on two runs of INC, each with 8 and 16 seconds as its task length, having 10,000 repetitions. The detailed description of the base data is from Table 16.

Machine	Task Length (sec)	Description	Experiment Period	Relevant
				Histograms
sodb9	INC8	10,000 samples	$2017-03-29 \sim 2017-03-30$	Figs. 40(a) and 40(b)
(plugged				
into the				
upper left				
power strip)				
sodb10	INC16	10,000 samples	$2017-03-29 \sim 2017-03-31$	Figs. 40(c) and 40(d)
(plugged				
into the				
upper left				
power strip)				

Table 16: Notes on experiment runs used for histograms

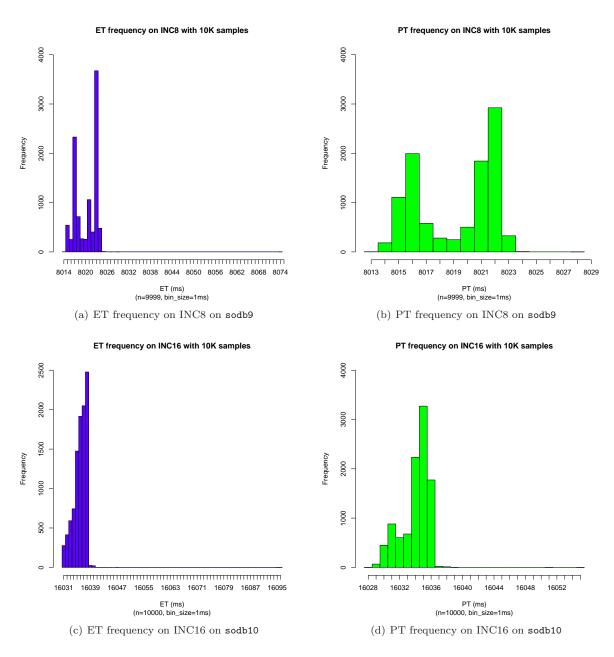

Figure 40: Histograms of INC8 and INC16 with 10,000 samples

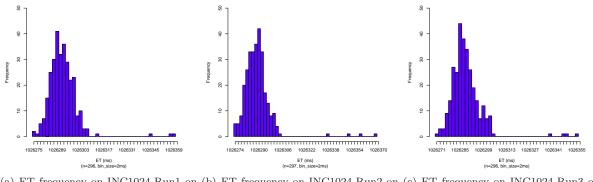

# 5 Histograms on Consecutive INC1024 Runs

This section exhibits histograms on (three) consecutive runs of INC1024. The detailed description of the base data is from Table 12.

Machine	Task Length (sec)	Description	Experiment Period	Relevant
				Histograms
sodb9	INC1024	300 samples, each	$2017-04-12 \sim 2017-04-23$	Figs. 41 and 42
(plugged				
into the				
upper left				
power strip)
