Repeatability Test

Young-Kyoon Suh July 27, 2017

1 Description

This document characterizes execution times measured on a simple program in pure-computation mode, called *INC*, with increasing task lengths (up to 16,384 seconds from 1 second). For the characterization, we present various histograms of INC throughout this document. The main goal of examining these histograms is to make sure if two (or more) histograms of INC with the same task length have the same shape or not. If that's the case, then we can say that such an INC run is so called *repeatable*; in other words, *repeatability* is satisfied in our experimental settings. Another goal is to uncover and explicate several interesting structures behind the histograms. The third goal is to build a statistical distribution (or model) fitting in the histograms, so that later we are capable of predicting a concrete execution time via the model on an arbitrary algorithm with a given input on a real execution environment.

In our experiments, we used EMPv5 [1]. (That said, the second step of EMPv5 was on purpose omitted, just to obtain better histograms by retaining more samples.) In the protocol, we use taskstats C struct to get measures of a captured process. The taskstat's data is delivered via a netlink socket from the kernel space. The receive buffer for the socket is not robust for many observed processes [2]. Fortunately, there is an average of 95 processes per iteration of a run, which turns out to be fine with the struct. For a much more number of processes, the use of /proc/[pid]/stat is preferred, as (i) there are equivalent measures available in the /proc filesystem, and (ii) there's little constraint on the use as opposed to taskstats.

Now we show histograms of elapsed time (ET) and process time (PT) of INC via the EMPv5 protocol.

2 Histograms on the First Run

This section exhibits histograms on the first run of INC with its task length increasing from 1 second to 4096 seconds. The detailed description of the base data is from Table 1.

3 Experiment Notes

Table 1 provides a short description of our experimental runs, on which the following histograms are based.

Machine	Task Length (sec)	Description Experiment Period		Relevant
				Histograms
sodb9	INC1~INC64	1000 samples, each	$2017-03-02 \sim 2017-03-04$	Figs. 1, 2, 5, and 6
sodb9	INC128~INC1024	300 samples, each	$2017-03-04 \sim 2017-03-11$	Figs. 3 and 7
sodb10	INC2048	300 samples	$2017-03-02 \sim 2017-03-09$	Figs. 4(a) and 8(a)
sodb12	INC4096	300 samples	$2017-02-13 \sim 2017-02-27$	Figs. 4(b) and 8(b)

4 Histograms on the Second Run

This section exhibits histograms on the second run of INC with its task length increasing from 1 second to 4096 seconds, via EMPv5 without Step 2. The detailed description of the base data is from Table 2.

Machine	Task Length (sec)	Description	Experiment Period	Relevant
				Histograms
sodb9	INC1~INC64	1000 samples, each	$2017-03-13 \sim 2017-03-14$	Figs. 9, 10, 13, and 14
sodb9	INC512~INC1024	300 samples, each	$2017-03-17 \sim 2017-03-21$	Figs. 11 and 15
sodb10	INC2048	300 samples	$2017-03-13 \sim 2017-03-20$	Figs. 12(a) and 16(a)
sodb12	INC4096	300 samples	$2017-03-02 \sim 2017-03-17$	Figs. 12(b) and 16(b)
sodb10	INC8192	261 samples	$2017-04-27 \sim 2017-05-21$	Figs. 12(c) and 16(c)
sodb12	INC16384	130 samples	$2017-04-27 \sim 2017-05-21$	Figs. 12(d) and 16(d)

Table 2: Notes on experiment runs used for histograms

 $\rm INC8192/INC16384$ unfortunately stopped in the middle of their runs due to a frozen vnc problem. So couldn't finish 300 samples.

4.2.1 Analysis

In this section we look into what happened inside the peaks observed in a certain histogram. We consider Figure 13(d) for this study. In the figure, we see the peaks at 8015 msec, 8020 msec, and 8021 msec.

Table 3 shows captured daemons and their runtime statistics per bin of figure. Note that bin is at the unit of PT. It appears that the peaks are definitely correlated with (1) appearances of some daemons and (2) times that those daemons co-ran with INC8.

TASK_LEN	BIN (PT)	DAEMON	MIN_PT	MAX_PT	AVG_PT	STD_PT	Counts
INC8	8013	jbd2/md0-8	1	1	1	0	1

5 Histograms with 10,000 samples

This section exhibits histograms on two runs of INC, each with 8 and 16 seconds as its task length, having 10,000 repetitions. The detailed description of the base data is from Table 4.

Machine	Task Length (sec)	Description	Experiment Period	Relevant
				Histograms
sodb9	INC8	10000 samples	$2017-03-29 \sim 2017-03-30$	Figs. 17(a) and 17(b)
sodb10	INC16	10000 samples	$2017-03-29 \sim 2017-03-31$	Figs. 17(c) and 17(d)

Table 4: Notes on experiment runs used for histograms

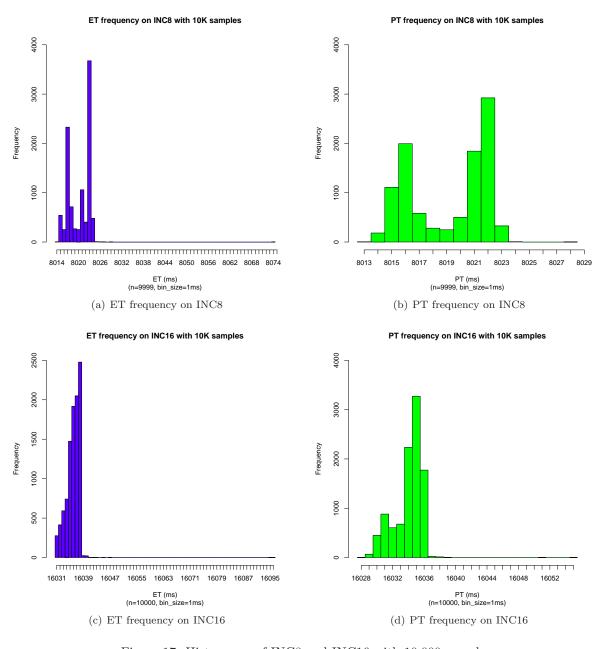

Figure 17: Histograms of INC8 and INC16 with 10,000 samples

6 Further Investigation of the First Run and Some Additional Runs

This section exhibits user and system time histograms on the second run of INC with its task length increasing from 1 second to 4096 seconds via EMPv5 with no Step 2. The detailed description of the base data is from Table 1, and for some additional data, the corresponding description is given in Table 5.

Machine	Task Length (sec)	Description	Experiment Period	Relevant
				Histograms
